Date: April 5, 2026

Definition of The Problem

Let us consider a continuum and a Cartesian reference system $(O; \mathbf{e}_1, \mathbf{e}_2, \mathbf{e}_3)$. The following displacement vector field is measured:

$$\begin{aligned} u_1(x_1, x_2, x_3) &= x_1 x_3 + x_2^2 + 1, \\ u_2(x_1, x_2, x_3) &= x_1 x_3^2 + x_1 x_2, \\ u_3(x_1, x_2, x_3) &= x_1^2 + 1, \end{aligned} \quad (1)$$

where (x_1, x_2, x_3) are the Cartesian coordinates of a point within the continuum.

Problem 1

Consider three material points on the continuum

- P_1 , with coordinates: $\begin{pmatrix} 1 & 0 & 1 \end{pmatrix}$;
- P_2 , with coordinates: $\begin{pmatrix} 1 & 1 & 1 \end{pmatrix}$;
- P_3 , with coordinates: $\begin{pmatrix} 0 & 2 & 1 \end{pmatrix}$;

Then:

- determine the components of the infinitesimal strain and rotation tensor for all points;
- determine the principal deformations and principal direction of deformations for all points.

Derivation

We start by determining the displacement gradient by finding the first derivatives of the displacement field:

$$\begin{aligned} u_{1,1} &= x_3, & u_{1,2} &= 2x_2, & u_{1,3} &= x_1, \\ u_{2,1} &= x_3^2 + x_2, & u_{2,2} &= x_1, & u_{2,3} &= 2x_1 x_3, \\ u_{3,1} &= 2x_1, & u_{3,2} &= 0, & u_{3,3} &= 0. \end{aligned}$$

Meaning

$$\nabla \mathbf{u} = [u_{i,j}] = \begin{bmatrix} x_3 & 2x_2 & x_1 \\ x_3^2 + x_2 & x_1 & 2x_1 x_3 \\ 2x_1 & 0 & 0 \end{bmatrix}.$$

The infinitesimal strain tensor ϵ is given by

$$\epsilon_{ij} = \frac{1}{2} (u_{i,j} + u_{j,i}) \implies \epsilon = \frac{1}{2} (\nabla \mathbf{u} + (\nabla \mathbf{u})^T)$$

and the rotation tensor ω is given by

$$\omega_{ij} = \frac{1}{2} (u_{i,j} - u_{j,i}) \implies \omega = \frac{1}{2} (\nabla \mathbf{u} - (\nabla \mathbf{u})^T).$$

So

$$\epsilon = \begin{bmatrix} x_3 & \frac{x_3^2 + 3x_2}{2} & \frac{3x_1}{2} \\ \frac{x_3^2 + 3x_2}{2} & x_1 & x_1 x_3 \\ \frac{3x_1}{2} & x_1 x_3 & 0 \end{bmatrix}$$

$$\boldsymbol{\omega} = \begin{bmatrix} 0 & \frac{x_2 - x_3^2}{2} & -\frac{x_1}{2} \\ \frac{x_3^2 - x_2}{2} & 0 & x_1 x_3 \\ \frac{x_1}{2} & -x_1 x_3 & 0 \end{bmatrix}.$$

Evaluating these at all three material points yields:

$$\boldsymbol{\epsilon}(P_1) = \begin{bmatrix} 1 & \frac{1}{3} & \frac{3}{2} \\ \frac{1}{2} & 1 & 1 \\ \frac{3}{2} & 1 & 0 \end{bmatrix} \quad \boldsymbol{\omega}(P_1) = \begin{bmatrix} 0 & -\frac{1}{2} & -\frac{1}{2} \\ \frac{1}{2} & 0 & 1 \\ \frac{1}{2} & -1 & 0 \end{bmatrix}.$$

The principal strains at P_1 is simply the eigenvalues of $\boldsymbol{\epsilon}(P_1)$ and the principal directions are their corresponding eigenvectors. Solving the eigenvalue problem gives:

$$\det(\boldsymbol{\epsilon}(P_1) - \lambda \mathbf{I}) = 0 \rightarrow \begin{pmatrix} 2.62977 & -1.24207 & 0.612303 \\ \{1.11589, 0.955931, 1.\} & \{-0.623383, -0.306997, 1.\} & \{15.1742, -22.1489, 1.\} \end{pmatrix}$$

The directions here are non-normalized and must therefore each be normalized as:

$$\begin{aligned} \frac{\begin{pmatrix} 1.11589 & 0.955931 & 1 \end{pmatrix}}{\left| \begin{pmatrix} 1.11589 & 0.955931 & 1 \end{pmatrix} \right|} &= \begin{pmatrix} 0.627835 & 0.537837 & 0.562632 \end{pmatrix} \\ \frac{\begin{pmatrix} -0.623383 & -0.306997 & 1 \end{pmatrix}}{\left| \begin{pmatrix} -0.623383 & -0.306997 & 1 \end{pmatrix} \right|} &= \begin{pmatrix} -0.511924 & -0.252107 & 0.821204 \end{pmatrix} \\ \frac{\begin{pmatrix} 15.1742 & -22.1489 & 1 \end{pmatrix}}{\left| \begin{pmatrix} 15.1742 & -22.1489 & 1 \end{pmatrix} \right|} &= \begin{pmatrix} 0.564792 & -0.824394 & 0.0372205 \end{pmatrix}. \end{aligned}$$

Hence the infinitesimal strain and rotation tensor for P_1 are

$$\boldsymbol{\epsilon}(P_1) = \begin{pmatrix} 1 & \frac{1}{2} & \frac{3}{2} \\ \frac{1}{2} & 1 & 1 \\ \frac{3}{2} & 1 & 0 \end{pmatrix} \quad \boldsymbol{\omega}(P_1) = \begin{bmatrix} 0 & -\frac{1}{2} & -\frac{1}{2} \\ \frac{1}{2} & 0 & 1 \\ \frac{1}{2} & -1 & 0 \end{bmatrix}.$$

And the principal strains and their directions are:

$$\begin{aligned} \lambda_1 &= 2,630 & \mathbf{n}_1 &= \begin{pmatrix} 0,628 \\ 0,538 \\ 0,563 \end{pmatrix} \\ \lambda_2 &= -1,242 & \mathbf{n}_2 &= \begin{pmatrix} -0,512 \\ -0,252 \\ 0,821 \end{pmatrix} \\ \lambda_3 &= 0,612 & \mathbf{n}_3 &= \begin{pmatrix} 0,565 \\ -0,824 \\ 0,037 \end{pmatrix}. \end{aligned}$$

For Point P_2 we follow the same procedure, first inserting the point into the strain and rotation tensors found as:

$$\boldsymbol{\epsilon}(P_2) = \begin{bmatrix} 1 & 2 & \frac{3}{2} \\ 2 & 1 & 1 \\ \frac{3}{2} & 1 & 0 \end{bmatrix}$$

$$\omega(P_2) = \begin{bmatrix} 0 & 0 & -\frac{1}{2} \\ 0 & 0 & 1 \\ \frac{1}{2} & -1 & 0 \end{bmatrix}.$$

Solving the eigenvalue problem yields

$$\det(\epsilon(P_2) - \lambda \mathbf{I}) = 0 \rightarrow \begin{pmatrix} 3.823 & -1.24542 & -0.577581 \\ \{1.57067, 1.467, 1.\} & \{-1.3131, 0.724229, 1.\} & \{0.242431, -0.941227, 1.\} \end{pmatrix}.$$

Normalizing the eigenvectors gives:

$$\begin{aligned} \frac{\begin{pmatrix} 1.57067 & 1.467 & 1 \end{pmatrix}}{\left| \begin{pmatrix} 1.57067 & 1.467 & 1 \end{pmatrix} \right|} &= \begin{pmatrix} 0.662601 & 0.618867 & 0.421859 \end{pmatrix} \\ \frac{\begin{pmatrix} -1.3131 & 0.724229 & 1 \end{pmatrix}}{\left| \begin{pmatrix} -1.3131 & 0.724229 & 1 \end{pmatrix} \right|} &= \begin{pmatrix} -0.728518 & 0.401808 & 0.554808 \end{pmatrix} \\ \frac{\begin{pmatrix} 0.242431 & -0.941227 & 1 \end{pmatrix}}{\left| \begin{pmatrix} 0.242431 & -0.941227 & 1 \end{pmatrix} \right|} &= \begin{pmatrix} 0.173846 & -0.674948 & 0.717094 \end{pmatrix}. \end{aligned}$$

The same is done for point P_3 yielding

$$\begin{aligned} \epsilon(P_3) &= \begin{bmatrix} 1 & \frac{7}{2} & 0 \\ \frac{7}{2} & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \\ \omega(P_3) &= \begin{bmatrix} 0 & \frac{1}{2} & 0 \\ -\frac{1}{2} & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}. \end{aligned}$$

Solving the eigenvalue problem and normalizing the vectors gives:

$$\begin{aligned} \det(\epsilon(P_3) - \lambda \mathbf{I}) = 0 \rightarrow & \begin{pmatrix} \frac{1}{2}(1+5\sqrt{2}) & \frac{1}{2}(1-5\sqrt{2}) & 0 \\ \{\frac{1}{7}(1+5\sqrt{2}), 1, 0\} & \{\frac{1}{7}(1-5\sqrt{2}), 1, 0\} & \{0, 0, 1\} \end{pmatrix}. \\ \frac{\begin{pmatrix} \frac{1}{7}(1+5\sqrt{2}) & 1 & 0 \end{pmatrix}}{\left| \begin{pmatrix} \frac{1}{7}(1+5\sqrt{2}) & 1 & 0 \end{pmatrix} \right|} &= \begin{pmatrix} 0.755454 & 0.655202 & 0. \end{pmatrix} \\ \frac{\begin{pmatrix} \frac{1}{7}(1-5\sqrt{2}) & 1 & 0 \end{pmatrix}}{\left| \begin{pmatrix} \frac{1}{7}(1-5\sqrt{2}) & 1 & 0 \end{pmatrix} \right|} &= \begin{pmatrix} -0.655202 & 0.755454 & 0. \end{pmatrix}. \end{aligned}$$

P_1

$$\epsilon(P_1) = \begin{bmatrix} 1 & \frac{1}{2} & \frac{3}{2} \\ \frac{1}{2} & 1 & 1 \\ \frac{3}{2} & 1 & 0 \end{bmatrix} \quad \omega(P_1) = \begin{bmatrix} 0 & -\frac{1}{2} & -\frac{1}{2} \\ \frac{1}{2} & 0 & 1 \\ \frac{1}{2} & -1 & 0 \end{bmatrix}$$

$$\lambda_1 = 2,630 \quad \mathbf{n}_1 = \begin{pmatrix} 0,628 \\ 0,538 \\ 0,563 \end{pmatrix}$$

$$\lambda_2 = -1,242 \quad \mathbf{n}_2 = \begin{pmatrix} -0,512 \\ -0,252 \\ 0,821 \end{pmatrix}$$

$$\lambda_3 = 0,612 \quad \mathbf{n}_3 = \begin{pmatrix} 0,565 \\ -0,824 \\ 0,037 \end{pmatrix}$$

 P_2

$$\epsilon(P_2) = \begin{bmatrix} 1 & 2 & \frac{3}{2} \\ 2 & 1 & 1 \\ \frac{3}{2} & 1 & 0 \end{bmatrix} \quad \omega(P_2) = \begin{bmatrix} 0 & 0 & -\frac{1}{2} \\ 0 & 0 & 1 \\ \frac{1}{2} & -1 & 0 \end{bmatrix}$$

$$\lambda_1 = 3,823 \quad \mathbf{n}_1 = \begin{pmatrix} 0,662 \\ 0,619 \\ 0,422 \end{pmatrix}$$

$$\lambda_2 = -1,245 \quad \mathbf{n}_2 = \begin{pmatrix} -0,729 \\ 0,402 \\ 0,555 \end{pmatrix}$$

$$\lambda_3 = -0,578 \quad \mathbf{n}_3 = \begin{pmatrix} 0,174 \\ -0,675 \\ 0,717 \end{pmatrix}$$

 P_3

$$\epsilon(P_3) = \begin{bmatrix} 1 & \frac{7}{2} & 0 \\ \frac{7}{2} & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \quad \omega(P_3) = \begin{bmatrix} 0 & \frac{1}{2} & 0 \\ -\frac{1}{2} & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}$$

$$\lambda_1 = \frac{1}{2}(1+5\sqrt{2}) \quad \mathbf{n}_1 = \begin{pmatrix} 0,755 \\ 0,655 \\ 0 \end{pmatrix}$$

$$\lambda_2 = \frac{1}{2}(1-5\sqrt{2}) \quad \mathbf{n}_2 = \begin{pmatrix} -0,655 \\ 0,755 \\ 0 \end{pmatrix}$$

$$\lambda_3 = 0 \quad \mathbf{n}_3 = \begin{pmatrix} 0 \\ 0 \\ 1 \end{pmatrix}$$

RESULT

Problem 2

Determine the mean normal strain and the strain deviator tensors, for the points p_1, p_2 , and p_3 .

Derivation

The strain ϵ can be decomposed to a mean normal strain ϵ_M and a strain deviator tensor ϵ_D as

$$\epsilon = \epsilon_M + \epsilon_D.$$

The mean normal strain ϵ_M is defined as

$$\epsilon_M = \frac{1}{3} (\epsilon_{11} + \epsilon_{22} + \epsilon_{33}) = \frac{1}{3} (x_3 + x_1 + 0) = \frac{x_1 + x_3}{3}.$$

And the deviator is

$$\epsilon_D = \epsilon - \epsilon_M \mathbf{I} = \begin{bmatrix} x_3 - \frac{x_1 + x_3}{3} & \frac{x_3^2 + 3x_2}{2} & \frac{3x_1}{2} \\ \frac{x_3^2 + 3x_2}{2} & x_1 - \frac{x_1 + x_3}{3} & x_1 x_3 \\ \frac{3x_1}{2} & x_1 x_3 & -\frac{x_1 + x_3}{3} \end{bmatrix}.$$

At P_1 we get

$$\begin{aligned} \epsilon(P_1) &= \begin{bmatrix} 1 & \frac{1}{2} & \frac{3}{2} \\ \frac{1}{2} & 1 & 1 \\ \frac{3}{2} & 1 & 0 \end{bmatrix} \\ \epsilon_M(P_1) &= \frac{1}{3} (1 + 1 + 0) = \frac{2}{3} \\ \epsilon_D(P_1) &= \epsilon(P_1) - \frac{2}{3} \mathbf{I} = \begin{bmatrix} \frac{1}{3} & \frac{1}{2} & \frac{3}{2} \\ \frac{1}{2} & \frac{1}{3} & 1 \\ \frac{3}{2} & 1 & -\frac{2}{3} \end{bmatrix}. \end{aligned}$$

At P_2 we get

$$\begin{aligned} \epsilon(P_2) &= \begin{bmatrix} 1 & 2 & \frac{3}{2} \\ 2 & 1 & 1 \\ \frac{3}{2} & 1 & 0 \end{bmatrix} \\ \epsilon_M(P_2) &= \frac{1}{3} (1 + 1 + 0) = \frac{2}{3} \\ \epsilon_D(P_2) &= \epsilon(P_2) - \frac{2}{3} \mathbf{I} = \begin{bmatrix} \frac{1}{3} & 2 & \frac{3}{2} \\ 2 & \frac{1}{3} & 1 \\ \frac{3}{2} & 1 & -\frac{2}{3} \end{bmatrix}. \end{aligned}$$

At P_3 we get

$$\begin{aligned} \epsilon(P_3) &= \begin{bmatrix} 1 & \frac{7}{2} & 0 \\ \frac{7}{2} & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \\ \epsilon_M(P_3) &= \frac{1}{3} (1) = \frac{1}{3} \\ \epsilon_D(P_3) &= \epsilon(P_3) - \frac{1}{3} \mathbf{I} = \begin{bmatrix} \frac{2}{3} & \frac{7}{2} & 0 \\ \frac{7}{2} & -\frac{1}{3} & 0 \\ 0 & 0 & -\frac{1}{3} \end{bmatrix}. \end{aligned}$$

$$\begin{aligned}
 P_1 \\
 \epsilon_M(P_1) &= \frac{2}{3} \\
 \epsilon_D(P_1) &= \begin{bmatrix} \frac{1}{3} & \frac{1}{2} & \frac{3}{2} \\ \frac{1}{2} & \frac{1}{3} & 1 \\ \frac{3}{2} & 1 & -\frac{2}{3} \end{bmatrix} \\
 P_2 \\
 \epsilon_M(P_2) &= \frac{2}{3} \\
 \epsilon_D(P_2) &= \begin{bmatrix} \frac{1}{3} & 2 & \frac{3}{2} \\ 2 & \frac{1}{3} & 1 \\ \frac{3}{2} & 1 & -\frac{2}{3} \end{bmatrix} \\
 P_3 \\
 \epsilon_M(P_3) &= \frac{1}{3} \\
 \epsilon_D(P_3) &= \begin{bmatrix} \frac{2}{3} & \frac{7}{2} & 0 \\ \frac{7}{2} & -\frac{1}{3} & 0 \\ 0 & 0 & -\frac{1}{3} \end{bmatrix}
 \end{aligned}$$

RESULT

Problem 3

Discuss whether the small gradient approximation is satisfied for the given displacement field. Can the infinitesimal deformation strain be used? Hint: Consider evaluating the discarded nonlinear (quadratic) term leading to the infinitesimal strain tensor.

Derivation

The Lagrangian strain is

$$\epsilon_{ij}^L = \frac{1}{2} (u_{i,j} + u_{j,i} + u_{k,i} u_{k,j})$$

and the infinitesimal strain is

$$\epsilon_{ij} = \frac{1}{2} (u_{i,j} + u_{j,i})$$

which means the discarded non-linear term is

$$\Delta = \frac{1}{2} u_{k,i} u_{k,j} = \frac{1}{2} (\nabla \mathbf{u})^\top \nabla \mathbf{u}.$$

Evaluating this at P_1 we obtain

$$\Delta(P_1) = \begin{bmatrix} 3 & \frac{1}{2} & \frac{3}{2} \\ \frac{1}{2} & \frac{1}{2} & 1 \\ \frac{3}{2} & 1 & \frac{5}{2} \end{bmatrix}.$$

Comparing this with the infinitesimal strain at P_1

$$\epsilon(P_1) = \begin{bmatrix} 1 & \frac{1}{2} & \frac{3}{2} \\ \frac{1}{2} & 1 & 1 \\ \frac{3}{2} & 1 & 0 \end{bmatrix}$$

we see that the discarded quadratic term $\Delta(P_1)$ is not small compared to the infinitesimal strain $\epsilon(P_1)$ meaning the small gradient approximation is *not* satisfied at P_1 .

At P_2 we get

$$\Delta(P_2) = \begin{bmatrix} \frac{9}{2} & 2 & \frac{5}{2} \\ 2 & \frac{5}{2} & 2 \\ \frac{5}{2} & 2 & \frac{5}{2} \end{bmatrix}$$

compared to the infinitesimal strain at P_2

$$\epsilon(P_2) = \begin{bmatrix} 1 & 2 & \frac{3}{2} \\ 2 & 1 & 1 \\ \frac{3}{2} & 1 & 0 \end{bmatrix}$$

the discarded quadratic term is not small compared to the infinitesimal strain meaning the small gradient approximation is, once again, *not* applicable at P_2 .

At P_3 we get

$$\Delta(P_3) = \begin{bmatrix} 5 & 2 & 0 \\ 2 & 8 & 0 \\ 0 & 0 & 0 \end{bmatrix}$$

which is several times larger than the infinitesimal strain at P_3

$$\epsilon(P_3) = \begin{bmatrix} 1 & \frac{7}{2} & 0 \\ \frac{7}{2} & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}$$

meaning the small gradient approximation is *not* satisfied at P_3 either.

The small gradient approximation is not satisfied for P_1, P_2 or P_3

RESULT
